#### **10 Years History of KHUPO**

The Korean Human Proteome Organization (KHUPO) was founded on July 24, 2001 as the first national organization under the auspices of HUPO (www.hupo.org) to integrate proteome research groups into international organizations, to engage in scientific and educational activities that spread proteomics technologies, and to disseminate knowledge pertaining to human diseases. The logos of HUPO and KHUPO were designed by KHUPO and acknowledged at this inaugural meeting. Dr. Young-Ki Paik served the first and second term of KHUPO president. In addition, following his service as the Secretary General of HUPO (2001-2006)/AOHUPO(2001-2007), he took a leadership as 4th president of HUPO (2009/2010) and 2<sup>nd</sup> president of AOHUPO (2008-2010). The 2<sup>nd</sup> KHUPO International meeting was held in conjunction with the inaugural meeting of AOHUPO in which about 800 members were attended. During the years of 2003-2006, three special issues of 'Proteomics' where most of the contributing authors are KHUPO members have

been published by the guidance of Y.-K. Paik (senior editor of the journal). Thus, it would be fair to say that the KHUPO can be regarded as a flagship proteome society with respect to history, member size and dynamic participation in HUPO activities.

KHUPO successfully hosted the HUPO 6<sup>th</sup> Annual World Congress at COEX Seoul, Korea in 2007. This Congress has been marked as one of the most successful HUPO congresses with the highest number of registrants. KHUPO has contributed to all facets of HUPO activities including its leading roles in numerous HUPO activities. For example, KHUPO members have served co-chair or chair of various HUPO initiatives: Chromosome-Centric Human Proteome Project (Y.-K. Paik), Human Brain Proteome Project (YM Park) and Stem Cell Proteomics (BH Lee). In addition, KHUPO published a technical textbook, 'Methods in Proteomics' in 2008 as part of her commitment to education and training.

For the last 10 years, KHUPO has been led by four presidents; Y-K Paik (2001-2005), Y-M Park (2005-2007), Jong Shin Yoo (2008-2009), and Ho Jeong Kwon (2010-2011). With 1150 member strong, KHUPO has recently hosted the 11<sup>th</sup> Annual Meeting in Busan, March 31-April 1. in commemoration with her 10<sup>th</sup> year birthday where about 400 members attended. In celebration with this event, KHUPO also published the KHUPO 10 Years history book.

KHUPO, along with her regional organizations of AOHUPO, has also been dedicated to promoting understanding of the proteomics. hosting by proteomics workshops and conferences during the past years. Thus, KHUPO will serve as a key part of world proteome societies and will continue to function in her unique role, under the auspices of HUPO.

Detailed information about the KHUPO is available at http://www.khupo.org/.

### 6<sup>th</sup> International Symposium of the Protein Society of Thailand

The Protein Society of Thailand (PST) organized the its 6<sup>th</sup> International Symposium at the Chulabhorn Convention Center, Bangkok on 31<sup>st</sup> August to 2<sup>nd</sup> September 2011. This year's meeting was jointly hosted by PST, Mahidol University, and Chulabhorn Research Institute. PST was honored to have Young-Ki Paik (Past President, Human Proteome Organization, HUPO), Kazuyuki Nakamura (President, Asia-Oceania Human Proteome Organization, AOHUPO), and Yuji Goto (Past President, Asia Pacific Protein Association, APPA) present as Invited Speakers, helping to link PST with regional and international organizations in protein research.

The main symposium program was attended by 269 registered participants, and included 10 Invited Lectures, 8 Oral Presentations selected from submitted Abstracts, plus 83 Posters presentations, competing for awards. Topics covered a broad spectrum of protein research, including structure and function relationships not only in enzymes but also in fibrous proteins, as well as the roles of proteins in various diseases, studied by various techniques, such as x-ray crystallography, protein NMR, stop-flow kinetics, microscopy and bioinformatics. The Protein Society (USA) also offered 3 Honorary Memberships to award-winning students. In addition, a Pre-Symposium workshop on "Disease Proteomics" was held one day before the symposium.

The Annual PST meetings have now developed a special character of their own, unlike any other meeting in Thailand. Special emphasis is placed on young scientists, at both young Ph.D. staff and graduate student level, since these young people will develop into future leaders of protein research. Efforts are also made to involve companies, both as Company Members and Exhibitors, because their involvement will help research develop in the country, which in the end will also benefit them. Most of all, meetings are arranged with the aim of being not only excellent academically but also enjoyable, through having a scientific program of international quality, accompanied by fun and games, arranged with the help of companies, so as to engage the young people.

PST is steadily growing in strength and would welcome the opportunity to host a regional protein meeting of APPA or AOHUPO in the near future.

Professor Jisnuson Svasti, President, Protein Society of Thailand

#### **Proteomics Activities in Vietnam**

In Vietnam, proteomics started actually just after the funding and setting up the number of key laboratories, being considered as one of the most important national activities for life science and biotechnology development in the period 2001-2005. The most related and advanced are the Laboratories for Gene and Protein Technologies at the Institute of Biotechnology (IBT), Vietnamese Academy of Science & Technology (VAST, Hanoi), the Laboratories for Protein and Enzyme Technology, Vietnam National University (VNU, Hanoi), Laboratories of Biochemistry and Molecular Biology at Hanoi University of Technology (HUT, Hanoi), Hanoi Medical University (HMU, Hanoi), Laboratories of Cell and Molecular Biology at the Institute of Tropical Biology (ITB, VAST, HoChiMinh City), Vietnam Military Medical University (VMMU, Hadong). Some newly modern well-equipped laboratories are located in different research institutions belonging to Ministry of Health, National/Regional Universities, Ministry of Agriculture and Rural Development... (Hanoi, Hue, Danang, Cantho, HoChiMinh City...). The research involves mostly traditional approach based on two-dimensional electrophoresis (2DE)/differential gel electrophoresis (DIGE) followed by mass spectrometric identification of proteins. Matrix-Assisted Laser Desorption Mass Spectrometry (MALDI-MS) has become a widely used for determination of biomolecules including peptides, proteins (IBT, VNU, VMMU...). Use of bioinformatics is essential for analyzing the massive amount of data generated from both genomics and proteomics. For the protein and proteome characterization, a new proteomic workflow that begins with an automated Nano-Multidimensional Liquid Chromatography (MDnanoLC Packing, Dionex, Netherland) system coupled online with a OSTAR<sup>®</sup> XL MS/MS System (MDS SCIEX/Applied Biosystems) with a NanoSpray<sup>™</sup> ion source has been established (IBT, VAST). Much of the work focus now on the human serum/urine proteome profiling, the identification of novel genes/proteins that might be related to the different kind of cancers, cardiovascular, neurodegenerative and infection diseases (IBT, VNU, HUT, HMU...).

Vietnam Proteomics Society (VNProteomics, VPS) established as a Cooperate Member/Sub-society under Vietnam Med-Biochemistry Association, intends to consolidate and promote scientific, innovative research and educational activities related to proteomics in Vietnam, and to facilitate the exchange of scientific information between scientists worldwide. The first VNProteomics Meeting was held on April 1-2, 2009, in Hai Phong with the participation of more than 90 scientists. The VNProteomics Council Members for the period 2009-2014 were elected as the representatives from different universities and research institutions all over the country: Phan Van Chi (Chairman, IBT, VAST, Hanoi), Trinh Hong Thai (VNU, Hanoi), Nguyen Bich Nhi (General Secretary, IBT, VAST, Hanoi), Hoang Van Son (Trang An Hospital, Vietnam Medical Association, Hanoi), Truong Quoc Phong (HUT, Hanoi), Nguyen Thanh Phuong (Can Tho University, CTU, Can Tho City), Phung Vo Cam Hong (Nong Lam University, HoChiMinh City), Pham Quang Chinh (Hue University, HU, Hue City), Dao Van Tan, (Hanoi National University of Education, HNUE, Hanoi), Le Van Dong (Vietnam Military Medical University, VMMU, Hadong). Proteomics education and training are the main focus of the most cited universities and research institutions. These activities include courses (basic and advanced courses), workshops, laboratory networking and tutorials. As proved by the recent meeting of the VNProteomics Council Members, some workshops will be organized during 2011-2012 and the second VNProteomics Meeting is planned on the March, 2013. Prepared by Phan Van Chi (chi@ibt.ac.vn)

### 3<sup>rd</sup> International Symposium on Frontiers in Agriculture Proteome Research: Contribution of proteomics technology in agricultural sciences

The 3rd International Symposium on "Frontiers in Agriculture Proteome Research: Contribution of proteomics technology in agricultural sciences" was held on November 8-10, 2011. The venue was Tsukuba International Congress Center (EPOCHAL) in Tsukuba Science City, about 50 km north of Tokyo. The symposium was attended by 152(38 from overseas and 114 in Japan)participants, and included 26 Invited Lectures. In the rapidly growing economics of world, food security has become a priority concern. With a rising population and climate change, efforts at enhancing agricultural productivity will be a key factor in alleviating this major concern. Proteomics is a powerful approach to identify a broad spectrum of proteins in living systems. This capability is especially useful for agriculture because it may give clues not only about nutritional value but also about yield production and how these factors are affected by adverse environmental conditions. In recent years, technical improvements in the extraction, separation, quantification, and identification of plant proteins have made the high-throughput analysis of cropproteins feasible, and the reproducibility of the technologyhas reduced errors in assaying protein levels. The application of mass spectrometry-based quantification methods have become mainstream, although gel-based quantification methods are still useful for proteomics analyses.

The symposium covered a vast area of plant proteomics related to growth and development of major crop plants and their response to various biotic and abiotic stresses. Furthermore insect, animal, microbes, and food proteomics were discussed in detail. Several talks about cutting-edge technologies for studying crop proteomics were presented. The contribution of proteomics in elucidating signaling mechanisms in plants was also highlighted. Integration of proteomics data with genomics and application of bioinformatics tools was emphasized. Finally, the application of proteomics in agriculture and molecular breeding programs was also presented and discussed. Questions from the budding researchers after each lecture made it an interactive and fruitful symposium.

Presented talks showed the breadth of proteome studies related to agriculture, despite the nascent stage of the field. While power of proteomics approach in studying important agricultural traits were presented, challenges remain to be addressed before proteomics research can be fully interpreted and applied in agriculture. It was agreed that continued improvement in reproducibility, sensitivity and accuracy of analytical tools, availability of advanced breeding materials and mutants, appropriate phenotypic measurements and filed studies, combining different "omics" technologies, and development of new bioinformatics remain critical for fruitful agricultural proteomics studies in near future.

The symposium provided unique opportunities for scientists in agricultural proteomics field to interact with each other, share views and knowledge and develop collaborative research projects to further enhance the application of proteomics in agriculture and food production. Agricultural proteome research community should support for holding symposium in this filed.

Setsuko Komatsu, National Institute of Crop Science, Tsukuba, Japan (skomatsu@affrc.go.jp)
